

## IDU Setup Instructions

- 1) Unpackage router and screw antennas onto the ports of the router (be sure not to screw antennas in too far as this could cause damage).
- 2) Plug router into power supply.
- 3) Place router in a location where you will be using internet the most i.e., office, living room, etc. (the further away you are from the router, the weaker the Wi-Fi signal will be).
- 4) For optimal connectivity, use the supplied Ethernet cable to directly connect your computer or device directly to the router.
- 5) Press the power button located in the back of the router. Allow several minutes for the router to boot up. Eventually all lights should turn green, which means the device has established a successful connection (internet light can be green, yellow, or orange and still maintain a connection).
- 6) On your smartphone, computer, or tablet, open the Wi-Fi settings within your device. Once the router is powered up you will see a new network name available in your wireless networks.
- 7) Select the new available network and enter the provided Wi-Fi key found on both the router box, and the bottom label of the device (Wi-Fi key is case sensitive).
- 8) Once you enter your Wi-Fi key you should see your device connected to your new Wi-Fi network.
- 9) For additional assistance, please email Trailrunner customer support at [info@mytrailrunner.com](mailto:info@mytrailrunner.com) or call us at 207-761-4286.
